Cash Flow Analysis Modified UCA Cash Flow Format

Dr. Charles W. Mulford Invesco Chair and Professor of Accounting

> Scheller College of Business Georgia Institute of Technology Atlanta, GA 30332-0520 (404) 894-4395

Analyzing Cash Flows

Selected income statement data and a cash flow statement in the UCA format are provided below for 5 cases. Each case is a variation on the income and cash flow statement for the same company. In fact, in every case, the company reports the same net income.

Use the data provided to draw what conclusions you can about the company's ability to service its outstanding long-term debt.

What additional questions are raised and what additional information would be helpful in answering them?

Income Statement Statement Data

Cases 1 - 3 Amounts in (000's)

CASE 4: Cash Flow Statement (000's)

Some Comments on the Cash Flow Cases

Case 1:

- Company is positive core operating cash flow, and operating cash flow. Cash available for debt service is sufficient to pay interest and required principal payments on LT debt.
- Capital expenditures of \$1,000 are financed with internal cash of \$810 and new financing of \$190. Cash generated from new investments can be earmarked to service the incremental long-term debt financing.
- Free cash flow is not positive. Co. can finance capital expenditures sufficient to replace fixed assets consumed in operations (\$800) with operating cash flow, but not capital expenditures needed to grow fixed asset base (\$1,000). This is not an unusual cash flow profile.

Case 2:

- Company is generating negative core operating cash flow. In addition, cash available for debt service is insufficient to service interest and required principal payments. Reasons for the cash shortfall can be traced to growth in A/R and Inventory, offset only slightly by the growth in A/P.
 - Is the growth in these account balances consistent with the growth in operations? Is it due to declining operating efficiency? Is it a seasonal phenomenon?
 - Working capital needs are being financed with \$1,300 in short-term debt financing (e.g., secured by A/R and/or Inventory) and from internal sources.
 - This viable financing plan assuming increases in A/R and Inventory are seasonal. If the cash needs are growth-related, longer-term financing should be sought.
- Capital expenditures of \$1,000 are financed with new long-term debt financing of \$1,000.

Case 3:

- Company is generating insufficient Cash available for debt service to service interest and required principal payments. The primary reason for the cash shortfall can be traced to the \$950 decrease in the deferred tax liability.
 - Is the amount out of the ordinary?
 - What does it potentially say about future capital expenditures?
 - More information is needed.
 - Normal level of deferred tax provision.
 - Management's capital expenditure plans.
- Additional long-term debt was used to finance the cash shortfall, which was mostly a refinancing of the current portion.
 - Not a long-term viable solution, unless deferred tax cash drain changes.
 - New capital expenditures (and more cash) are likely needed for this to occur.

Case 4:

- Company is less profitable than in cases 1 3. While it is generating sufficient Cash available for debt service to service interest and current portion, the primary reason is so-called "Other recurring cash receipts."
 - What is the source of the other income?
- The cash flow statement indicates a cause for concern even though long-term debt was reduced during the current year.
 - If other income is non-recurring, the company will, in the future, be unable to service interest and the current portion.

CASE 5: Cash Flow Statement (000's)

Case 5:

- Company is losing money, though generating ample cash flow to service interest and current portion.
- Source of operating cash flow is depreciation and declines in accounts receivable and inventory. Apparently, the company is liquidating itself.
- Long-term debt service capacity would require a return to profitable operations.

Analyzing Core Operating Cash Flow Using Ratios to Identify Borrowing Causes

Key determinants of changes in the components of Core operating cash flow:

- Growth a pervasive underlying borrowing cause which impacts all other cash flow determinants.
- Profitability Measures:
 - Gross Margin % = Gross Margin / Revenue
 - SG&A % = SG&A / Revenue
- Operating Efficiency Measures:
 - Receivables in days = A/R / Revenue per Day
 - Note: Revenue per Day = Revenue / 365
 - Inventory in days = Inventory / Revenue per Day
 - Payables in days = A/P / Revenue per Day

Cash Flow Variance Analysis

The key determinants of changes in the components of Core operating cash flow can be used to perform a two-way cash flow variance analysis.

That is, reasons for changes in the components of Core operating cash flow can be identified as being caused by 1) growth or 2) an inherent change in the underlying profitability or efficiency of the firm.

In measuring the impact on Core operating cash flow caused by growth, prior year profitability and efficiency measures are assumed to remain unchanged in the current year, allowing the cash impact of growth to be isolated.

In measuring the impact on Core operating cash flow caused by changes in profitability or efficiency measures, the change from the prior year in the relevant profitability or efficiency measure is applied to current year results.

On the following pages, selected financial statement and cash flow data for Industrial Services, Inc., a growth firm, are provided.

Industrial Services, Inc. Comparative Income Statements Years Ended Mar. 31, 2018 and 2017 (Amounts in 000's)

Required principal payments on LT debt		(0)
Dividends on common stock		
Short-term debt		
Long-term debt financing		
Financing transactions		0
Change in cash and equivalents after financing		\$ (1,205)

Key points noted in the accompanying financial statements and notes:

- Sales and earnings are up 18% and 28% respectively in 2018 over 2017.
- The company is profitable, generating an operating profit of \$1,209 in 2018 and net income of \$810.
- Core operating cash flow was an outflow of \$774.
- Operating cash flow was an outflow of \$1,205 and corresponded with the decrease in cash. The company financed its cash needs internally.

In discussions with management, the following was learned:

- The increase in SG&A was due mainly to an increase in marketing costs accompanying a new sales campaign.
- The cash balance is uncomfortably low and insufficient to finance an anticipated growth in working capital needed to support future growth in operations.
- Additions to PP&E are needed to increase production levels needed to support anticipated sales increases.
- The company took advantage of vendor cash discounts for early payment for the first time in 2018.

Required:

- 1) Use two-way cash flow variance analysis to determine the causes of the cash flow drain. Specifically, for the change in each component of Core operating cash flow, determine the extent to which 1) growth and 2) a change in the firm's underlying profitability or efficiency was the explanatory factor.
- 2) What is the importance of determining the extent to which growth or changes in profitability and efficiency contributed to the firm's cash needs?
- 3) If the firm is generating an outflow for Core operating cash flow, how can it service new financing needed for PP&E additions?

Industrial Services, Inc. Cash Flow Variance Analysis Years Ended Mar. 31, 2018 and 2017

Core Operating Growth Profile

A Closer Look at the Profiles of Cash Generators and Cash Consumers As Revenues Grow

It is a generally accepted view that growth requires investments of cash. In this view, cash is needed for permanent investments in current assets such as receivables and inventory to support growth. As revenues grow, increasing amounts must be carried in receivables and inventory. Other such assets include prepaid expenses.

Providing cash to help finance these investments are vendor-related liabilities such as accounts payable and accrued expenses payable, and customer financing such as deferred revenue.

In actuality, some companies can grow at significant rates and still provide core operating cash flow as they grow. In fact, the faster they grow, the more positive core operating cash flow they generate.

At other companies, very modest growth may result in significant cash needs.

Knowing a company's profile – whether it is a cash generator or cash consumer with growth – is vital in understanding financial performance.

Core operating growth profile --

The capacity of a firm to generate core operating cash flow as it grows reflecting a combination of its operating cushion and operating working capital requirements, expressed as a percentage of revenue. It is measured as operating cushion % less operating working capital to revenue %. It is forward looking and reports the amount of core operating cash flow that can be expected for any measured amount of growth in revenue under the assumption that a firm's current mix of operating cushion and operating working capital remains unchanged. A firm with a positive operating growth profile® can grow operations and produce increasing amounts of core operating cash flow. A firm with a negative operating growth profile® will require other sources of cash to support revenue growth.

The operating cushion % reflects the contribution of a \$1 dollar increase in revenue to operating profit before non-cash expenses like depreciation. If working capital needs were non-existent, then the operating cushion % would be the core operating growth profile.

The higher the operating cushion %, the more cash a company will generate as it grows. Consuming that cash are increasing needs for receivables and inventory, less payables, as revenues grow.

Stated another way, the higher the operating cushion % and the lower the cash cycle, the more cash a company will generate (or the less it will consume) as it grows revenue.

In 2017, Industrial Services had an operating cushion % of 9.56% and a cash cycle of 133.14 days. During the ensuing 2018, under the burden of that profile of operating cushion % and cash cycle, the company consumed \$620 in core operating cash flow as it grew revenues by \$2,304 or 18%.

Developing the Core Operating Growth Profile

Instead of reporting the cash cycle in days, let us report it in terms of a percent of revenue.

That is, Receivables in days of 59.998 days becomes 16.44% (2,104 / 12,800), reflecting the % of every revenue dollar that is uncollected at year-end. Inventory in days of 111.583 days becomes 30.57% (3,913 / 12,800), reflecting the % of every revenue dollar must be carried in inventory. Payables in days of 38.440 becomes 10.53% (1,348 / 12,800), reflecting the % of every revenue dollar for which financing is provided by vendors.

As an aside, note that while a days statistic, such as A/R days, is measured as A/R / (revenue / 365), in percent terms we are simply measuring A/R / revenue and leaving out the 365 computation. The % approach still reflects the relative investment needed in A/R.

Armed with % terms, we can now measure Industrial Services' core operating growth profile in terms of revenue.

As of 2017 year end Industrial Services' Core operating growth profile was:

Gross margin% (excl. depn) SG&A% (excl. depn) Operating cushion %	$39.56\% \\ - 30.00\% \\ = 9.56\%$
A/R to revenue % Inventory to revenue % A/P to revenue % Working capital %*	- 16.44% - 30.57% + <u>10.53%</u> - <u>36.48%</u>
Core operating growth profile	- 26.92%

Core operating growth profile

*Denotes % of 365 day year tied up in working capital.

Applying the Core Operating Growth Profile

For Industrial Services, a negative core operating growth profile of -26.92% indicates that for every \$1 increase in revenue, the company will consume 26.92 cents in core operating cash flow.

During 2018, Industrial Services grew revenues by \$2,304.

\$2,304 x .2692 equals a use of cash of \$620, which is the cash impact of growth shown in the Cash Drivers Report.

Analysts must be aware that if revenue growth is projected for the company, arrangements must be made to meet the projected cash needs.

Improvements in the Company's core operating growth profile will result in less onerous cash requirements of growth.

Free Cash Growth Profile -

The capacity of a firm to generate sustainable free cash flow as it grows, reflecting a combination of its core operating growth profile, income taxes paid, capital expenditures and other investments needed to support operations, expressed as a percentage of revenue. It is measured as operating cushion % less operating working capital to revenue % less income taxes paid to revenue %, and less capital expenditures to revenue %, investment in operations-related intangibles to revenue %, and investment in other ops-related assets to revenue %. It is forward looking and reports the amount of sustainable free cash flow that can be expected for any measured amount of growth in revenue under the assumption that a firm's current mix of operating cushion, operating working capital, income taxes paid to revenue % and capital expenditures, investment in operations-related intangibles and investment in other ops-related assets to revenue % remain unchanged. A firm with a positive free cash growth profile® can grow operations and produce increasing amounts of sustainable free cash flow. A firm with a negative free cash growth profile® will require other sources of cash to support revenue growth.

The free cash growth profile extends the core operating growth profile metric to include taxes as a percent of revenue and capital expenditures as a percent of revenue.

The metric measures the change in free cash flow for every dollar increase in revenue.

For Industrial Services, we don't know the amount of income taxes paid or capital expenditures during 2017. Using 2018 figures as a percent of 2018 revenue as an approximation, we have:

Income taxes paid \$431 divided by revenue of 15,104 = 2.9%

Capital expenditures \$0 or 0% of revenue.

The Free cash growth profile becomes:

Environmental Services, Inc. Identifying Borrowing Causes

Selected financial statement data for Environmental Services, Inc. for the year ended March 31, 2018 are provided on the following pages. Also provided is a cash flow statement prepared in the Modified UCA format.

A quick review of the cash flow statement indicates that the company is experiencing an operating cash flow drain. Core operating cash flow is an outflow of \$7,176 and Operating cash flow is an outflow of \$8,402.

Required:

1) Where has the company obtained the cash needed to meet the requirements of a negative Core operating cash flow (\$7,176), interest paid (\$348), current portion (\$208), and capital expenditures (\$4,422)?

2) Why has Core operating cash flow turned negative in 2018? Identify if the reasons are growth-related or due to changes in the company's operating cushion and operating working capital. Use the Cash Impact Worksheet provided to help you in answering this question.

3) What is Environmental Services' Core Operating Growth Profile? Free Cash Growth Profile?

Note, analyzing Core operating cash flow (before taxes) does not analysis of the tax accounts.

Calculating Cash Flow Profiles

Brown-Forman, Inc.

Required:

- 1. Calculate the company's core operating growth profile and free cash profile as of year-end 2015. Other income is not material and may be ignored.
- 2. What do these profiles imply about the company's ability to generate cash flow as it grows?
- 3. What are the implications for a change in free cash flow of a \$50 million increase in revenue?

Calculating Cash Flow Profiles

Apple, Inc.

Required:

1. Calculate the company's core operating growth profile and free cash profile as of year-end 2017. Exclude other income, other non-current assets and other non-current liabilities from your calculations.

2. What do these profiles imply about the company's ability to generate cash flow as it grows?

3. What are the implications for free cash flow of a \$20 billion increase in revenue?

SOLUTION NOTE Environmental Services

Required:

1) Where has the company obtained the cash needed to meet the requirements of a negative Core operating cash flow (\$7,176), interest paid (\$348), current portion (\$208), and capital expenditures (\$4,422)?

Long-term debt and equity financing.

What is unclear without analyzing the sources of the operating cash flow drain is whether the outflow for operations is due to growth or to declining trends in the company's profitability or efficiency.

2) Why has Core operating cash flow turned negative in 2014? Identify if the reasons are growth-related or due to changes in the company's operating cushion and operating working capital. Use the Cash Impact Worksheet provided to help you in answering this question. See the worksheet for details.

Though the company enjoyed significant growth, growth consumed very little core operating cash flow, about \$129. The company's profile of operating cushion and low working capital needs is why.

The worsening of the company's profile, including its operating cushion and operating working capital profile consumed significant amounts of cash in 2014, totaling \$9,469.

3) Core Operating Growth Profile:
